 Re: Vitality measurements intensely worn BIOJWL

Mr. van der Starre sent his intensely worn BIOJWL dark green with the Vitruviusman (12 mm) in it to do a new measurement.

Five energetic parameters are presented in table 1, determined by the radiesthesia.

	Energetic properties	Pendant Vitruvius dark green April 1, 2021
1	The Bovisvalue (biophysical energy content)	491,000
2	The Positivity of this Bovisvalue	10
3	The Intention of the Producers	10
4	Negative Information in the BIOJWLS	0.008
5	Elektromagnetic Pollution in the BIOJWLS	0.010

Table 1: the energetic properties of dark green pendant Vitruvius intensely worn during five months.

The first parameter has been measured on the scale of Bovis. The other four parameters are measured on a scale from 0 to 10. Parameter 2 and 3 should be as close to 10 as possible. Parameter 4 and 5 should be as close to 0 as possible.

We still see excellent energetic properties of the intensely worn pendant.

An equal dark green pendant had been measured November 10 and it had a Bovis value of 438,000.

The Bovis values appear to have increased. This can be explained by the way the jewels are manufactured and the specific way they are programmed.
